

One shared formula, compared with measurements

Candidate CMF-1/2: RM-ell0-w1-ridge0. No object-specific refit, dark matter, expansion or adjusted distances.

Coma cluster | light-image distortion

Fixed 100 Mpc lens distance; source efficiency beta = 1

Coma: bands are two assumed ordinary-source profiles, not confidence intervals. beta = 1 is the maximum static source-distance factor; finite source distances reduce all shown lensing curves. No fitted lens amplitude is used. Points were reconstructed from Kubo et al.'s figure.

Newtonian light baseline: ballistic rays at speed c, giving half the standard weak-field deflection. The dotted gray curves show that standard ordinary-matter light law for context. Galaxy points trace the rotation field (often gas), not an individually tracked star. All data were previously exposed.

NGC 3198 | circular orbital speed

Fixed catalog distance 13.8 Mpc; train-labelled object
